today autonomous robots are used in a rather limited range of applications such as exploration of inaccessible locations cleaning floors mowing lawns etc however ongoing hardware improvements and human fantasy steadily reveal new robotic applications of significantly higher sophistication for such applications the crucial bottleneck in the engineering process tends to shift from physical boundaries to controller generation as an attempt to automatize this process evolutionary robotics has successfully been used to generate robotic controllers of various types however a major challenge of the field remains the evolution of truly complex behavior furthermore automatically created controllers often lack analyzability which makes them useless for safety critical applications in this book a simple controller model based on finite state machines is proposed which allows a straightforward analysis of evolved behaviors to increase the model s evolvability a procedure is introduced which by adapting the genotype phenotype mapping at runtime efficiently traverses both the behavioral search space as well as recursively the search space of genotype phenotype mappings furthermore a data driven mathematical framework is proposed which can be used to calculate the expected success of evolution in complex environments
